

Develop a script to:

1. Crawl the “allconferences.com” website to collect the list of events. The home page is a good place to start for categories and sub-categories of events. All events, including upcoming and past events, should be collected. There are approximately 100K events to collect.
2. For each event, visit the event website found in “Conference Web Site” link.
3. Find the “Contact Us” page and extract contact email address(es) (and name(s) if possible).
4. For each event, collect:
  - a. Event name
  - b. Event dates (if possible)
  - c. Contact email(s)
  - d. Contact names (if possible)
5. Place the results into a CSV file.
6. For events that are not successfully extracted, the script should provide the reason (where it stopped) it could not extract the information.
7. Provide working source code.
